# Session 4 - DDI using machine learning

## Assignment

The main program parses all XML files in the folder given as argument and classifies drug-drug interactions between pairs of drugs. The program must use a **ML classification** algorithm to solve the problem.

```
$ python3 ./ml-DDI.py data/Devel/  
DDI-DrugBank.d398.s0|DDI-DrugBank.d398.s0.e0|DDI-DrugBank.d398.s0.e1|effect

# Relation Extraction

- Relation Extraction is a NLP task, frequently required in Information Extraction applications.
- The goal of the task is to extract relations between entities (previously detected), expressed in the text.  
E.g.: `is_CEO_of(Person,Organization)`:
  - *Steve Jobs* was the chairman, the chief executive officer (CEO), and a co-founder of *Apple Inc.*, ...
  - During his career at *Microsoft*, *Bill Gates* held the positions of chairman, chief executive officer (CEO), president and chief software architect.
  - *Mark Zuckerberg* is known for co-founding *Facebook, Inc.* and serves as its chairman, chief executive officer, and controlling shareholder.

# Relation Extraction

Other examples:

- **Medical domain:**

- `caused_by(diagnose, drug)`
  - `prescribed_for(drug, diagnose)`
  - `drug_interaction(drug, drug)`

- **Legal domain:**

- `is_suing(Person/Org, Person/Org)`
  - `is_representing(Person, Person/Org)`
  - `is_sentenced_for(Person/Org, Crime)`
  - `is_sentenced_to(Person/Org, Penalty)`

- **Business/Economy:**

- `is_CEO_of(Person, Organization)`
  - `absorbed_by(Organization, Organization)`

- etc.

# Relation Extraction

Relation Extraction can be approached as a classical ML classification task, where:

- The objects to be classified are a **text fragment** (sentence, paragraph...) plus a **pair of target entities** in it.
- Each object (*text, entity1, entity2*) is encoded as a feature vector.
- The output class is either **None**, or one **relation type** chosen among a *predefined list*.

Informative enough features are crucial to get good results.

# General Structure

Extracting features is a costly operation, which we do not want to repeat for every possible experiment or algorithm parametrization.

# General Structure

Feature extraction process is performed once, out of learning or predicting processes.

# General Structure

Feature extraction process is performed once, out of learning or predicting processes.

Thus, we need to write not a single program, but three different components: feature extractor, learner, and classifier.

We will use Stanford CoreNLP dependency parser, which can be called via `nltk`, and integrates a [tokenizer](#), a [part-of-speech](#) tagger, and a [dependency parser](#).

- Download and uncompress [Stanford CoreNLP](#).
- Provided class `deptree.py` will handle calling the parser and access the resulting structure

# Functions - Analyze text

```
text = 'Caution should be exercised when combining resorcinol or  
       salicylic acid with DIFFERIN Gel'  
analysis = deptime(text)

# Feature Extractor

The feature extractor:

- Independent program, separated from learner and classifier
- Receives as argument the directory with the XML files to encode.
- Prints the feature vectors to stdout

```
$ python3 ./feature-extractor.py data/devel > devel.feats
```

# Feature Extractor Functions - Extract features

```
def extract_features(tree, entities, e1, e2) :
```

Task:

Given an analyzed sentence and two target entities, compute a feature vector for this classification example.

Input:

tree: a DependencyGraph object with all sentence information.  
entities: A list of all entities in the sentence (id and offsets).  
e1, e2 : ids of the two entities to be checked for an interaction

Output:

A vector of binary features.  
Features are binary and vectors are in sparse representation (i.e. only active features are listed)

Example:

```
>>> extract_features(tree, {'DDI-DrugBank.d370.s1.e0':['43','52'],  
                             'DDI-DrugBank.d370.s1.e1':['57','70'],  
                             'DDI-DrugBank.d370.s1.e2':['77','88']},  
                      'DDI-DrugBank.d370.s1.e0', 'DDI-DrugBank.d370.s1.e2')  
['lb1=Caution', 'lb1=be', 'lb1=exercise', 'lb1=combine', 'lib=or', 'lib=  
=salicylic', 'lib=acid', 'lib=with', 'LCSpos=VBG', 'LCSlema=combine',  
 'path=dobj/combine\nmod\compound' 'entity_in_between']  
,,,

# Learner - Option 1: Maximum Entropy

Machine  
Learning DDI

Relation  
Extraction

General  
Structure

Resources

Detailed  
Structure

Learner

Core task

Goals &  
Deliverables

- Use megam to train a model as seen in class
- megam does not expect the extra information in the features file, thus the first 3 fields (*sent\_id*, *ent\_id1*, *ent\_id*) must be removed:

```
python3 extract-features.py data/train | cut -f4- > train.feats  
./megam-64.opt -nc -nobias multiclass train.feats >model.MEM
```

# Learner - Option 2: Your choice

- Select a ML algorithm of your choice (DT, SVM, RF, ...) and a python library implementing it.
- Adapt the feature file format to the needs of the selected algorithm
- Train a classification model for the task of **classifying** entity pairs.

Note that the target task is a mere classification, not a sequence prediction. So, for a given sentence and pair of entities in it, the output is just **one** label, not a sequence. Thus, sequence labeling algorithms such as CRFs are overdimensioned (and probably not straightforward to apply).

# Detecting interactions: Possible features

Some feature possibilities to explore:

- Features detailing the position of words in the sentence (e.g. before E1, between E1 and E2, after E2)
- More general (or more specific) path features (with/without all elements in the path, lemma/tag of each, etc)
- Features encoding specific tree patterns (and maybe their combination with certain verbs). E.g. Features stating whether patterns used in Task 3 apply.
- Information about the LCS (PoS, lemma, ...)
- Features considering lists of relevant verbs.
- Type of entities in the pair
- Presence of a third entity (in the sentence, in between the target pair, in the path connecting the pair in the tree, ...)
- ...

# Exercise Goals

What you should do:

- Work on your feature extractor. It is the component of the process where you have most control.
- Pay special attention to features encoding **syntactic information**.
- Experiment with different parameterizations of the chosen learner. You may try different learning algorithms if you feel up to. Note that the same feature vectors can be fed to different learners.
- Keep track of tried features and parameter combinations.

What you should **NOT** do:

- Use neural network learners. We'll do that later on the course.
- Alter the suggested code structure.
- Produce an overfitted model: If performance on the test dataset is much lower than on devel dataset, you probably are overfitting your model.

# Exercise Goals

## Orientative results

- Provided feature extractor uses 7 feature templates and gets a macroaverage F1 about 47%. Used information includes :
  - word forms, lemmas, and PoS tags (and combinations) appearing in between the target pair.
  - information on the path connecting both target entities: whole path, path from e1 to LCS, path from e2 to LCS.
- Extending feature repertorie with different pieces of information from the tree, and experimenting with learner parameters should raise macroaverage F1 on devel up to 60%.

# Deliverables

Write a report describing the work carried out in this exercise.

The report must be a **single self-contained PDF document**, under ~10 pages, containing:

- *Introduction*: What is this report about. What is the goal of the presented work.
- *Rule-based baseline*
  - *Ruleset construction*: What did you observe in the data exploration. Which rules did you write according to those observations.
  - *Code*: Include your `check_interaction` function (and **any other function** it may call), properly formatted and commented. **Do not include any other code.**
  - *Experiments and results*: Results obtained on the **devel** and **test** datasets, for different rule combinations you deem relevant.

Goals &  
Deliverables

# Deliverables (continued)

- *Machine learning DDI*

- *Selected algorithm:* Which classifier/s did you select or try. Reasons of the choice. Comparison if you tried more than one.
- *Feature extraction:* Tried/discarded/used features. Impact of different feature combinations
- *Code:* Include your `extract_features` function (and **any other function** it may call), properly formatted and commented. **Do not include any other code.**
- *Experiments and results:* Results obtained on the **devel** and **test** datasets, for different algorithms, feature combinations, parameterizations you deem relevant.
- *Conclusions:* Final remarks and insights gained in this task.

**Keep result tables in your report in the format produced by the evaluator module. Do not reorganize/summarize/reformat the tables or their content.**
